Project Overview & Objectives

Minor Project — VLSI Domain

What is an ALU?

An Arithmetic Logic Unit (ALU) is the core computational component of any processor. It performs arithmetic and logical operations on binary data. An 8-bit ALU processes operands that are 8 bits wide, making it a foundational building block in digital design and embedded systems.

Project Objectives

- Design an 8-bit ALU supporting 8 distinct operations using Verilog HDL
- Implement a modular, scalable architecture with separate sub-modules per operation
- Verify functionality through comprehensive testbench simulation in Xilinx Vivado
- Synthesize & implement on FPGA with power and timing analysis
- Document RTL schematic, DRC reports, and implementation logs

ALU Architecture & Signal Flow

Inputs, Operations, and Outputs

Port Specification

Port	Width	Direction	Description
A[7:0]	8-bit	Input	Operand A
B[7:0]	8-bit	Input	Operand B
carry_in	1-bit	Input	Carry / Borrow input
SEL[2:0]	3-bit	Input	Operation selector (opcode)
Result[7:0]	8-bit	Output	Computed result
carry_out	1-bit	Output	Carry / Borrow output
zero_flag	1-bit	Output	High when Result = 0

Flags: carry_out propagates MSB shift or arithmetic overflow.
zero_flag asserts when Result == 8'b00000000.

SEL Opcode Map

SEL	Operation	Expression
3'b000	ADD	$A + B + \text{Cin}$
3'b001	SUB	$A - B - \text{Cin}$
3'b010	AND	$A \& B$
3'b011	OR	$A B$
3'b100	XOR	$A \wedge B$
3'b101	NOT	$\sim A$
3'b110	SHL	$A \ll 1$
3'b111	SHR	$A \gg 1$

Verilog HDL Design — ALU.v

Full Source Code: Module Declaration, Logic Assignments & Case Statement

```
timescale 1ns / 1ps
// alu_top.v - Main 8-bit ALU Module (Positional Order Baseline)
module ALU(
    input  [7:0] A,          // Position 1
    input  [7:0] B,          // Position 2
    input    carry_in,      // Position 3
    input  [2:0] SEL,        // Position 4
    output reg [7:0] Result, // Position 5
    output reg    carry_out, // Position 6
    output    zero_flag     // Position 7
);

// Internal wires for combinational sub-modules
wire [7:0] sum, diff, out_and, out_or, out_xor, out_not, out_shl, out_shr;
wire    sum_carry, diff_carry;

// 1. Arithmetic Operations Logic
assign (sum_carry, sum) = A + B + carry_in;
assign (diff_carry, diff) = A - B - carry_in;

// 2. Logical Operations Logic
assign out_and = A & B;
assign out_or  = A | B;
assign out_xor = A ^ B;
assign out_not = ~A;

// 3. Shifter Operations Logic
assign out_shl = A << 1;
assign out_shr = A >> 1;

// Output Routing Multiplexer (Purely Combinational)
```

```
always @(*) begin
    case (SEL)

RTL Schematic — Xilinx Vivado

Synthesized Register Transfer Level view of the 8-bit ALU design

Simulation Waveform Results

All 8 operations verified — Xilinx Vivado Simulation (120 ns window)

Waveform Analysis & Verification

Test Case Results — All 8 Operations

Op	SEL	A	B	Cin	Result	Cout	Zero	Status
ADD	3'b000	0x0F	0x0F	0	0x1E	0	0	PASS
SUB	3'b001	0xFF	0x01	0	0xFE	1	0	PASS
NOT	3'b101	0xAA	—	—	0x55	0	0	PASS
SHL	3'b110	0x01	—	—	0x02	0	0	PASS
SUB (Zero)	3'b001	0x05	0x05	0	0x00	0	1	PASS

Key Observations

- All 5 tested operations produce correct results as per truth table analysis
- Zero flag correctly asserts when $0x05 - 0x05 = 0x00$ (Test Case 5)
- Carry output correctly propagated for ADD and SUB operations
- NOT operation correctly inverts only operand A ($0xAA \rightarrow 0x55$)
- SHL correctly shifts A left by 1 bit with MSB going to carry_out

Power Analysis Report

Xilinx Vivado Power Estimation

Power Summary

Category	Value	Share
Total On-Chip	5.478 W	100%
Dynamic	5.384 W	98%
• Signals	0.324 W	6%
• Logic	0.188 W	3%
• I/O	4.873 W	91%
Device Static	0.093 W	2%

Thermal Notes

Junction Temp: 35.3°C | Thermal Margin: 49.7°C
Confidence Level: Low (no XDC constraints)

DRC Report & Design Rule Check

Design Violations & Resolution Path

Tcl Console Messages Log Reports Design Runs DRC x Power Timing	
Q [Icons] [2 Critical Warnings] [1 Warning] [Hide All]	
Name	Details
▼ All Violations (3)	
▼ Pin Planning (3)	
▼ NSTD-1 (1)	
NSTD #1	30 out of 30 logical ports use I/O standard (IOSTANDARD) value 'DEFAULT', instead of a user assigned specific value. This may cause I/O contention or incompatibility with the board power or connectivity affecting performance, signal integrity or in extreme cases cause damage to the device or the components to which it is connected. To correct this violation, specify all I/O standards. This design will fail to generate a bitstream unless all logical ports have a user specified I/O standard value defined. To allow bitstream creation with unspecified I/O standard values (not recommended), use this command: set_property SEVERITY (Warning) [get_drc_checks NSTD-1]. NOTE: When using the Vivado Runs infrastructure (e.g. launch_runs Tcl command), add this command to a .tcl file and add that file as a pre-hook for write_bitstream step for the implementation run. Problem ports: A17:0 , B17:0 , Result17:0 , SEL12:0 , carry_in , carry_out , zero_flag .
▼ UCIO-1 (1)	
UCIO #1	30 out of 30 logical ports have no user assigned specific location constraint (LOC). This may cause I/O contention or incompatibility with the board power or connectivity affecting performance, signal integrity or in extreme cases cause damage to the device or the components to which it is connected. To correct this violation, specify all pin locations. This design will fail to generate a bitstream unless all logical ports have a user specified site LOC constraint defined. To allow bitstream creation with unspecified pin locations (not recommended), use this command: set_property SEVERITY (Warning) [get_drc_checks UCIO-1]. NOTE: When using the Vivado Runs infrastructure (e.g. launch_runs Tcl command), add this command to a .tcl file and add that file as a pre-hook for write_bitstream step for the implementation run. Problem ports: A17:0 , B17:0 , Result17:0 , SEL12:0 , carry_in , carry_out , zero_flag .
▼ CFGBVS-1 (1)	
CFGBVS #1	Neither the CFGBVS nor CONFIG_VOLTAGE voltage property is set in the current design. Configuration bank voltage select (CFGBVS) must be set to VCCO or GND, and CONFIG_VOLTAGE must be set to the correct configuration voltage, in order to determine the I/O voltage support for the pins in bank 0. It is suggested to specify these either using the 'Edit Device Properties' function in the GUI or directly in the XDC file using the following syntax: set_property CFGBVS value1 [current_design] #where value1 is either VCCO or GND set_property CONFIG_VOLTAGE value2 [current_design] #where value2 is the voltage provided to configuration bank 0 Refer to the device configuration user guide for more information.

DRC Violations Found

NSTD-1 — Critical

30 ports using DEFAULT IOSTANDARD (no XDC pin constraints assigned)

UCIO-1 — Critical

30 ports have no LOC constraint; pin location unspecified

CFGBVS-1 — Warning

CFGBVS / CONFIG_VOLTAGE not set for bank 0

Resolution: Add a .xdc constraints file specifying IOSTANDARD, LOC, and CFGBVS properties for all 30 ports to generate a valid bitstream.

Implementation Reports — Vivado

Synthesis: 6/9/26 11:02 AM | Implementation (Place+Route): 6/23/26 10:25 AM | All design stages completed successfully

Conclusion & Future Scope

Achievements

- Successfully designed 8-bit ALU with 8 operations
- Fully verified through Vivado simulation (all 5 test cases PASS)
- RTL schematic, synthesis & implementation completed
- Power analysis and DRC reports generated
- Purely combinational design using always @(*)

Future Enhancements

- Add signed arithmetic (overflow detection)
- Implement multiply and divide operations
- Add XDC constraints for bitstream generation
- FPGA deployment on Basys3 / Nexys board
- Expand to 16-bit or 32-bit ALU for RISC core

"This project establishes a strong foundation for digital design, processor architecture, and FPGA implementation."

Thank You

Aryan Singh
